Team Name : Team 404

Team Leader Name : Sinega Selvakumar

Problem Statement : Build an AI-powered solution that helps people learn faster, work smarter, or become more productive while building or understanding technology.

Brief about the Idea:

An AI mentor that teaches the right concept, at the right time, in the right way.

TechSaarthi AI is an AI-powered learning and productivity assistant designed to help students and developers in India learn faster and work smarter while building technology.

Unlike traditional AI tools that provide generic answers, TechSaarthi AI uses a Context-Aware Learning & Builder Guide to understand the user's goal, current task, skill level, and learning progress, and delivers precise, step-by-step guidance exactly when it is needed.

By offering micro-explanations, adaptive explanation depth, and proactive hints, the solution reduces information overload, improves comprehension, and significantly boosts productivity for learners and developers.

Difference from Existing Solutions:

Most existing AI tools act as generic chatbots and provide static responses for learning queries.This solution uses context awareness to tailor explanations based on user goals, task stage, and skill level.

How the Solution Addresses the Problem:

By analyzing the learner's context, the system delivers concise, step-by-step guidance instead of long explanations.
This improves clarity, reduces learning time, and enables users to apply knowledge effectively.

Unique Selling Proposition (USP):

The key USP is a **Context-Aware Learning & Builder Guide** that adapts in real time.
It delivers the right information at the right moment, improving learning efficiency and productivity.

Features offered by the solution:

Context-Aware Learning Assistance

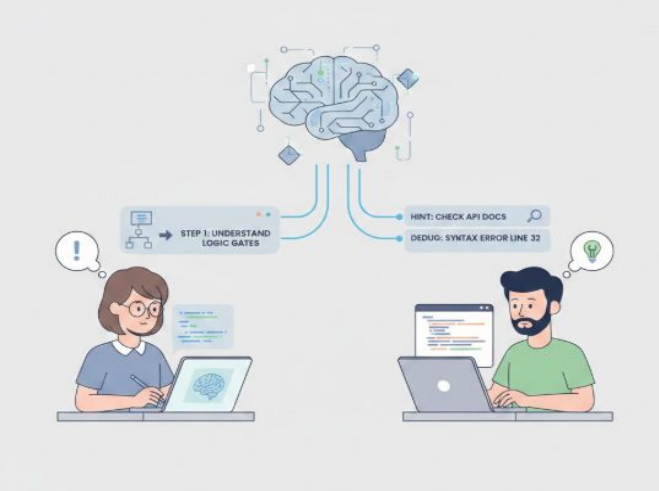
The system understands what the user is trying to do and their current skill level. It provides explanations that match the task the user is working on.

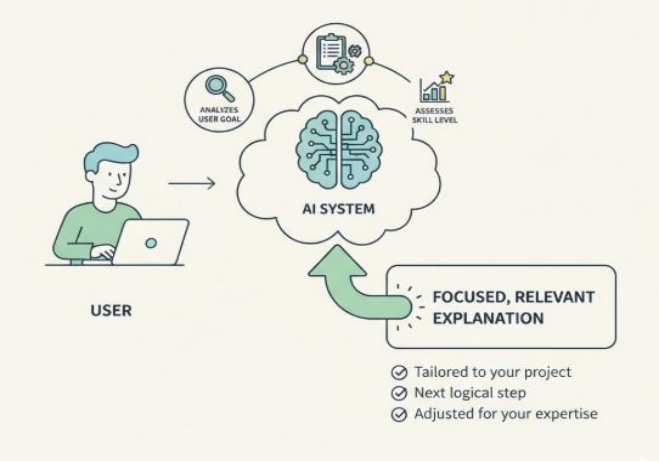
Guided Learning and Building Support

The solution explains concepts, code, and documentation step by step.This helps users learn in a structured way and apply knowledge while building projects.

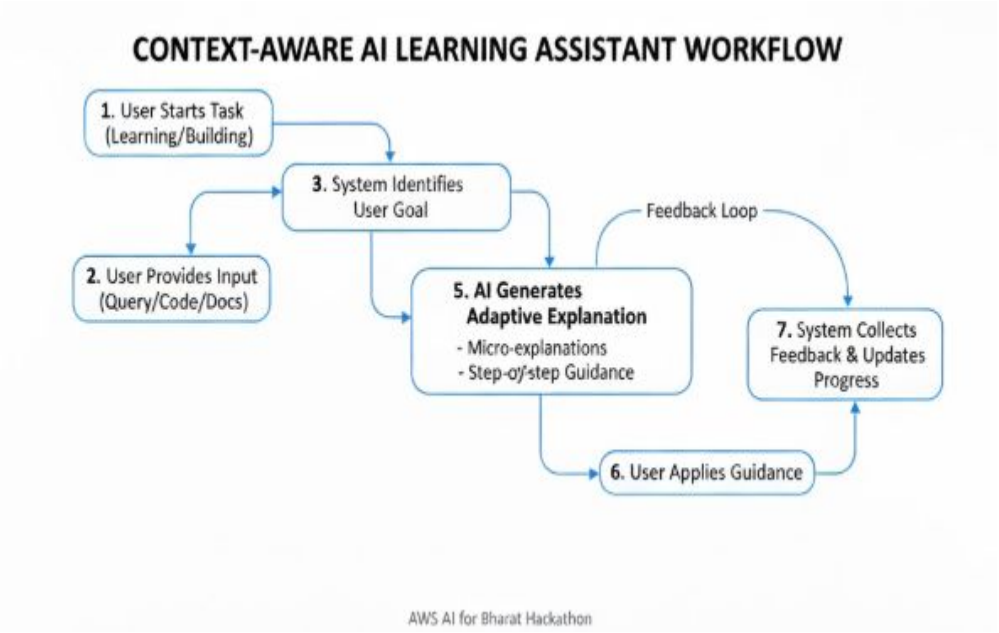
Adaptive Explanation and Feedback

The explanation level adjusts from basic to advanced based on user progress.It also gives helpful hints and feedback to reduce mistakes and improve efficiency.

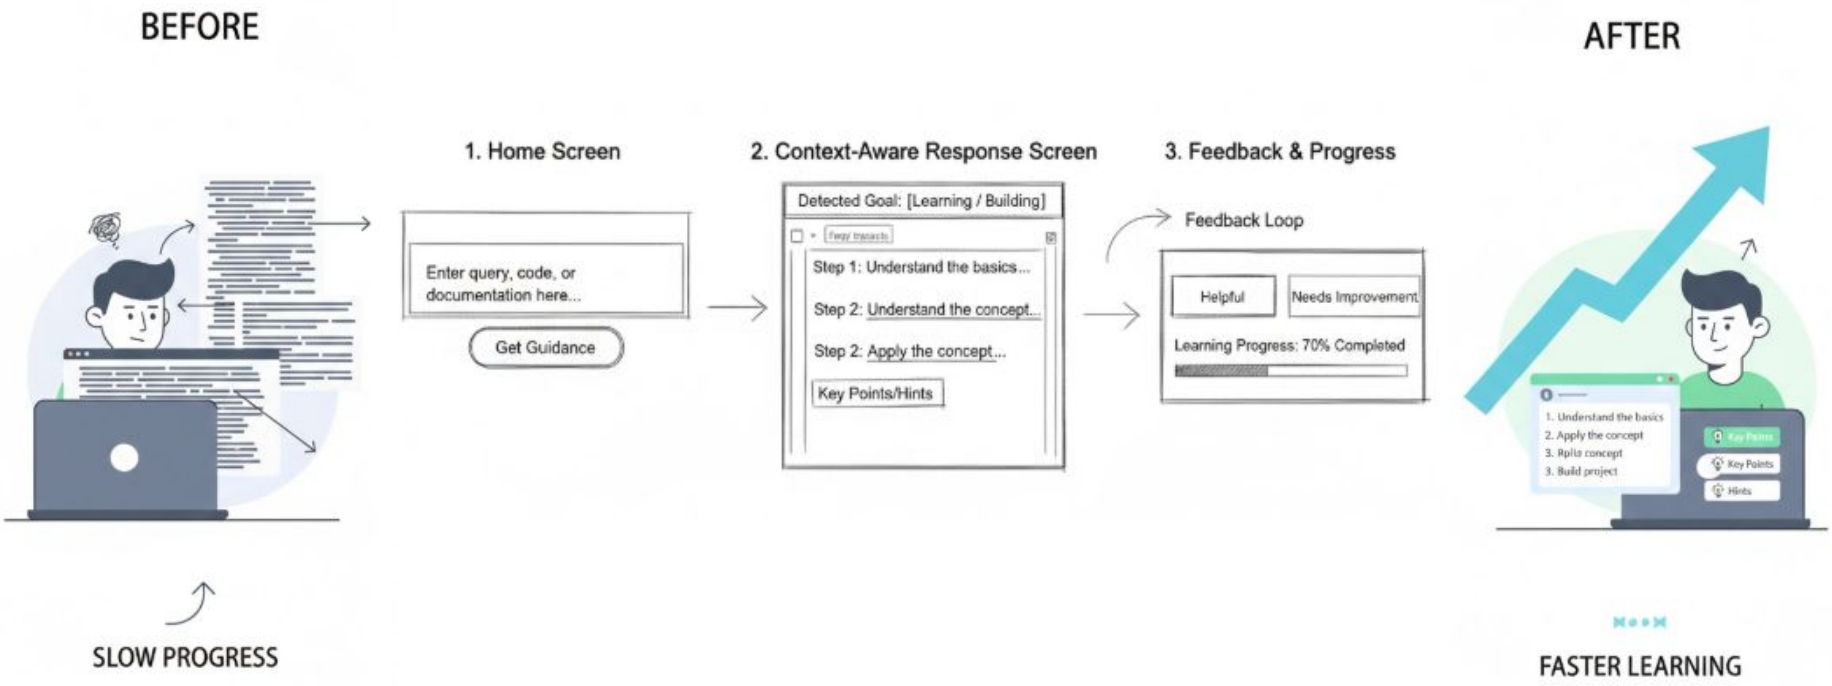




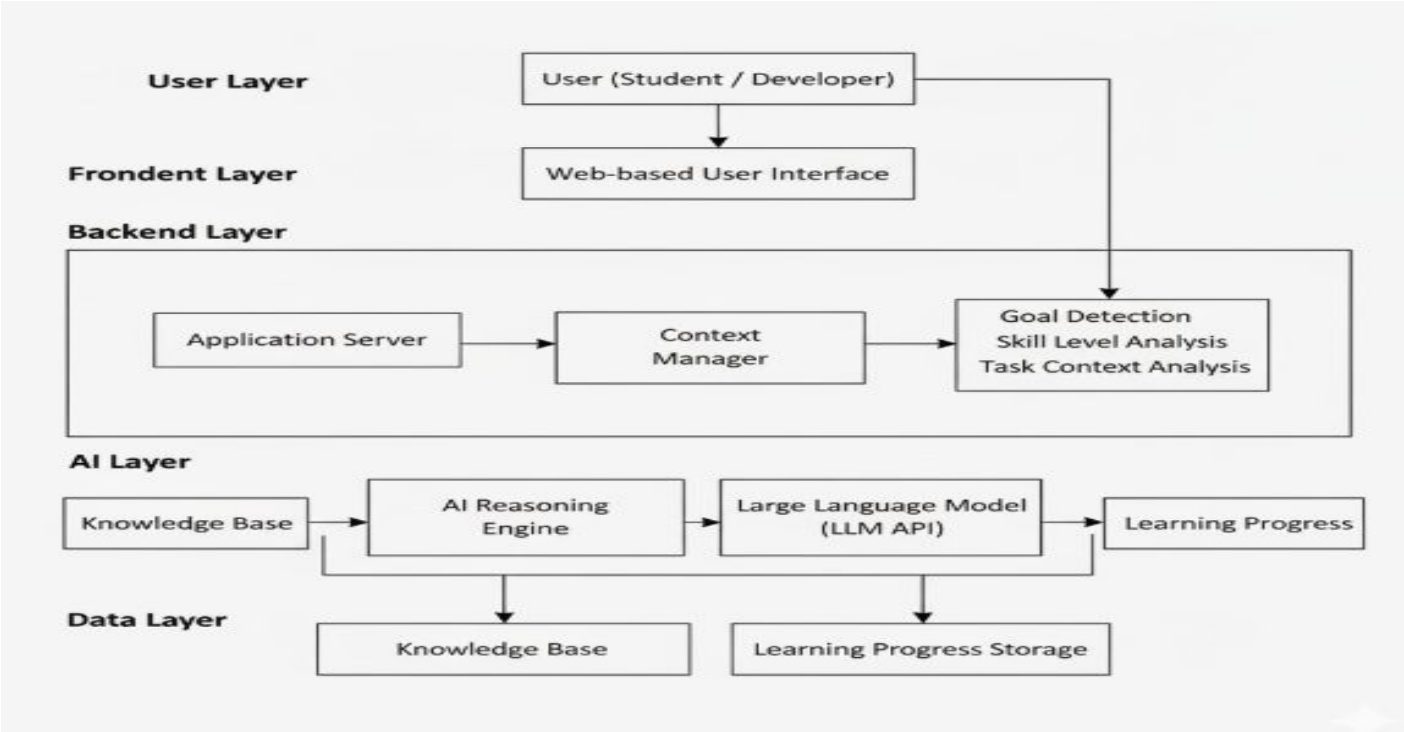
Flow Diagram :



Mock Diagram :



Architecture diagram of the proposed solution:



Technologies to be used in the solution:

Frontend:

React.js

TypeScript

Backend:

Node.js

Express.js

MongoDB

Deployment:

Git

Github

Vercel

AI & Intelligence Layer:

Grok Ai

Gemini AI

ChatGPT

AI Brain

Hackathon Submission Compliance:

- **Documentation Requirements**
  The project includes a GitHub repository with requirements.md and design.md files.
  Both documents are generated and maintained using Kiro as per the hackathon guidelines.

- **Kiro Usage Requirement**
  The repository contains the mandatory /.kiro directory generated during development.
  This ensures compliance with the required AI-assisted development workflow.

- **Presentation & Submission**
  The solution is explained using the provided PPT template and submitted in PDF format.
  All required artifacts are included and aligned with the problem statement.
